

Case Study **SERVER ROOM (TOYOTA)**

BACKGROUND

Toyota Industrial Equipment has been a VASEY service and project customer since 2011.

PROBLEM

The Toyota's server room cooling system connected to production ceased operation. Consequently, the server was overheating. If left unattended the server would crash and production would come to a halt. VASEY received an emergency service call in the middle of the night.

SOLUTION

With VASEY's 24/7/365 service operation and highly skilled technicians, the server room cooling system was repaired with no adverse effect to production.

END RESULT

By the next morning, VASEY had the cooling system up and running. More importantly, manufacturing and production kept running without any interruptions.
